

# Checkpoint Static testing

## Individual Static Review Report

### Identified Defects

#### Defect 1: Email Domain Restriction

- Specification: Login must be any valid email address.
- Code: Accepts only `@gmail.com`.
- Issue: Implementation does not match the requirement because the spec will only work for Gmail and will fail for Yahoo Mail, hotmail and other mail.

#### Defect 2: Lowercase Requirement Not Implemented

- Specification: Login must be lowercase.
- Code: The regex allows `uppercase letters (A-Z)`.
- Issue: Requirement not enforced.

#### Defect 3: Ambiguous Requirement

- Specification: "Login can contain any character."
- Issue: Contradicts valid email format and lowercase rule.

#### Defect 4: Password Validation Incorrect

- Specification: The password must be 6 numbers.
- Code: Checks only the minimum length of 6 characters. I.e `password.length < 6`.
- Issue: Does not check the exact length but checks only the minimum length of 6 characters.

## Suggested Corrections

- Update email regex to allow any valid lowercase email.
- Enforce lowercase validation or convert input to lowercase.
- Clarify the ambiguous requirement about "any character".
- Validate the password to accept 6 digits. e.g.,  
`password.length <= 6`

## Quality Improvement Recommendations

- Remove contradictory requirements.
- Make requirements clear and testable.
- Improve password security requirements (6-digit passwords are weak).

## Conclusion

The work product contains:

- Requirement inconsistencies
- Implementation defects
- Ambiguities in specifications

The code does not fully satisfy the stated requirements and requires correction before approval.
